

TECHFUEL Travel Battery Charger

1. Remove Travel Battery Charger from packaging and locate flip plug on back of Travel Battery Charger. Lift or flip the plug outward to reveal plug.
2. Plug Travel Battery Charger into Power Source. LED light will light green if charger and power source are working correctly.
3. When installing your battery on the charger it is important to make sure that the positive (+) contact on the battery is lined up with the positive (+) charge point on the charger. When your battery's positive (+) contact is lined up with the positive (+) charge point on the charger the negative (-) contact on your battery will automatically line up correctly. You may need to flip your battery over to make connections match up correctly.

Please note that the middle contact (T) on the battery will not line up with a charge point on the charger. The (T) contact does not play a role in the charge process but instead communicates battery information to the camera.

4. Once contacts are lined up, slide the battery into the charger by sliding towards the contact points. Battery will push in the contact points and battery will snap down into charger.
5. When battery snaps into place the LED light will change to red. This indicates that the battery is installed correctly and the battery is charging.
6. When battery has completed the charge cycle the LED light will turn green and the battery is charged and ready to use.

7. Your Travel Battery Charger comes with a car charger and a European adaptor to enable you to charge on the go.
